⚡ Forge

From ticket to pull request.
No terminal needed.

Ship features into your existing codebase — from your browser.

Product Vision & Strategy — Confidential
March 2026

The Problem

Every engineering team has the same bottleneck. The PM knows exactly what needs to happen, but can't make it happen without a developer's time.

```
PM writes ticket → ticket sits in backlog → weeks pass → developer
eventually picks it up

47 tickets in the backlog. Two developers.
Small fixes, bug patches, straightforward features — all waiting in
line.

What if the PM could just click a button?
```

How Forge Works

1

Write

PM describes what they need. Forge's AI generates a detailed spec with acceptance criteria, file changes, and test requirements.

2

Develop

PM clicks **"Develop."** Forge runs the real Claude Code CLI in a secure cloud sandbox. Auto-flight: no questions, just implements.

3

Review

A pull request appears on GitHub. The developer reviews it — not writing from scratch, but reviewing code that follows the team's patterns.

```
Write ticket → Refine → Approve → ⚡ Develop → PR created → Dev
reviews → Ship
```

The Change Record

This isn't "vibe coding." Every decision is documented. Every risk flagged. Every file tracked. The reviewing developer has full context without having been there.

```
Change Record for AEC-2437: Webhook Retry Logic
────────────────────────────────────────────────

Execution Summary:
Added exponential retry logic to the webhook delivery system
using a dedicated Bull queue processor.

Decisions Made:
✦ Used Bull queue pattern (not inline retry)
   → Matches existing BackgroundFinalizationService
✦ Exponential backoff: 1s, 2s, 4s, 8s
   → Industry standard, RFC 7231
✦ Max 5 retry attempts
   → Matches project's existing configurations

Risks Identified:
⚠ No dead-letter queue for permanently failed webhooks
   → Logged for future ticket

Files Changed:
+ src/webhooks/webhook-retry.processor.ts (+89 lines)
~ src/webhooks/webhooks.module.ts (+12 -2)
~ src/webhooks/webhook.service.ts (+23 -4)
+ src/webhooks/__tests__/retry.spec.ts (+124 lines)

Tests: 18 passed, 0 failed
PR: #42 on feat/aec-2437-webhook-retry
```

The Three-Tier Model

Forge adapts to the complexity of the work — and protects its margins in the process.

⚡

Quick Flow

PM types what they need.
Claude implements instantly.
PR + ticket auto-created.

Small fixes · **~$0.52/dev**

🚀

Cloud Develop

PM writes ticket with spec.
Clicks "Develop."
Claude implements on auto-flight.

Small/medium features · **~$1.53/dev**

👤

Developer + CLI

Developer uses the CLI locally
with their own Claude subscription.
Full power for complex work.

Complex/architectural · **$0 to Forge**

Small/medium work → PM handles from browser (Forge earns revenue). Complex work → Developer handles with CLI (Forge cost: $0, still gets lifecycle tracking). **The expensive stuff costs us nothing.**

Why Forge Wins

LOVABLE / BOLT

Build new apps from scratch. Can't touch your existing codebase. Prototype quality. No tests, no PR review, no audit trail.

FORGE

Ships features into your **existing** 500-file codebase. Production quality. Runs your tests. Creates PRs. Full Change Records.

CURSOR / COPILOT

Developer tools in a terminal. Requires a developer to be present. Suggests lines of code, not entire features.

FORGE

PM tool in a browser. Developer reviews the PR after. Implements **entire tickets**, not lines.

HIRING A DEVELOPER

$10,000–25,000/month. Weeks to onboard. Context switching between tickets. PM waits for availability.

FORGE

$39–99/month. Instant. Full codebase context. PM triggers development anytime. **3-4x team throughput.**

The Value Proposition

Forge doesn't replace developers. It changes their role from **writer** to **reviewer**.

```
Without Forge:
2 developers at $24,000/mo total
Ship ~20 features/month
Cost per feature: ~$1,200
PM waits for developer availability

With Forge:
2 developers at $24,000/mo total   ← same headcount
Forge Team at $99/mo   ← tiny add-on
Ship ~60-80 features/month   ← 3-4x throughput
Cost per feature: ~$400
PM triggers development anytime
```

Business Model

PLAN	PRICE	CLOUD DEVELOPMENTS	TARGET
Free	$0	2/month	Try it, get hooked
Pro	$39/mo	20/month	Solo PMs, small teams
Team	$99/mo	50/month	Growing teams
Scale	$199/mo	Unlimited	Ship fast (future)

Gross margin: ~78%. Blended cost per development: ~$0.92 (expensive work handled by developers using their own tools = $0 to Forge).

What's Already Built

Forge isn't a pitch deck. It's a working product.

- ✓ AI-assisted ticket creation
- ✓ Spec generation with acceptance criteria
- ✓ Review Q&A system
- ✓ Approval workflow
- ✓ Project profiles (codebase context)
- ✓ Change Record system

- ✓ GitHub integration (OAuth + App)
- ✓ MCP bridge for developer CLI
- ✓ Real-time job monitoring
- ✓ Email notifications
- ✓ Team/workspace management
- ✓ Linear-inspired design system

What's next: The "Develop" button — Cloud Develop (Epic 18). This is the feature that closes the loop and makes everything above 10x more valuable.

"Your PM writes the ticket. Claude writes the code.
Your developer reviews the PR.
Everyone does what they're best at."
